

Aegis - Project Charter

Team Information

Team #18

Team Members:

- Charles Law - calaw@purdue.edu
- Michael Lenkeit - mlenkeit@purdue.edu
- Bilsha Das - bmohanda@purdue.edu
- Jayden Deason - deasonj@purdue.edu

Problem Statement

Current task management tools like are overloaded with features that are overwhelming and have a steep learning curve, especially for small teams and individual users who need a straightforward way to manage tasks. Our task management system will focus on simplicity, prioritizing core features like task creation, assignment, and progress tracking without unnecessary complexity.

Project Objectives

The primary objectives for our project are to:

- Develop a task-management system to enable users to CRUD new tasks with an intuitive interface
- Use an authentication system to maintain security
- Use a permission-based system to control who can create or modify tasks
- Provide analytics on tasks, including priority and task deadline
- Enable communication between users with chats tied to each task

Stakeholders

- Developers -
 - Charles Law - frontend
 - Michael Lenkeit - backend
 - Bilsha Das - frontend
 - Jayden Deason - backend
- Users: People interested in project management and need to assign and collaborate on tasks with common document repository.
 - Individuals and small teams
- Project Coordinator

- Hao Wang
- Project Owners
 - Charles Law
 - Michael Lenkeit
 - Bilsha Das
 - Jayden Deason

Deliverables/Features:

- A website that displays user tasks in several different views, including a list of tasks, calendar, timeline and urgency views in both personal and group views.
 - Search functionality to search for specific tasks, filtering by text, person, importance, etc.
 - Enables users to chat with and assign tasks to each other, with the ability to set a due date and importance level.
 - Users can be in multiple servers, each with their own separate channels, and can directly message other users and form private group chats.
 - Each task contains details, a document repository and group chat with relevant assignees and assigners within each task.
 - Custom permission-based access for each task and its associated properties.
 - Robust security with two-factor authentication.
- Secure MySQL database that stores user preferences, logs, statuses, and other relevant information, updating as necessary

Platforms and Frameworks:

- Backend implemented using Java
- Frontend implemented using Vue.JS
- Data will be stored in a MySQL database
- Deployed using Docker
